

## Setup for email on various Operating Systems and various Email programs should work with the following settings: -

### ***NOTES for BOTH setup methods: -***

- This is a “POP” account, NOT an “IMAP” account
- Enable SLS/TLS”
- Outgoing server(smtp) requires authentication
- If you wish to see your emails on more than one client, tick the box to leave mail on server BUT PLEASE not longer than 30 days(longer will make your server overburdened!)

### ***AUTOMATIC method(usually set as default)***

In most cases, using the “automatic” method with: -

- FULL email address
- Password
- “mail host” (IF required) of [mail.yourdomainname.com](mailto:mail.yourdomainname.com) (.net for some of you)

Now sit back and watch it happen .....

### ***MANUAL method if “Automatic fails”***

Should the “automatic” method not work then **DELETE** or **REPAIR** that account and ... start again in “**Manual**” mode using the following settings:

**Note: In MS Outlook, after selecting “Repair” Tick the box that says “Advanced” then make changes to “incoming” & Outgoing” servers**

- **Username:** your FULL email address
- **Password:** your password
- **Incoming Mail Server:** mail.yourdomainname.com/net  
**Incoming Mail Port:** 995
- **Outgoing Mail Server:** mail.yourdomainname.com or smtp.yourdomainname.com  
**Outgoing Mail Port:** 465

***Please send us any feedback or suggestions that may be of help to other SeaWebs Clients***
